Safety Notices

1. Please read all instructions before installing and powering the unit. You should keep these instructions in a safe place for future reference.
2. If the power supply shows signs of damage or malfunction, stop using it immediately, turn off the power and disconnect the power supply before contacting your supplier for a repair or replacement.
3. Changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment. Use only the accessories, attachments, and power supplies provided by the manufacturer – connecting non-approved antennas or power supplies may damage the unit, cause interference or create an electric shock hazard, and will void the warranty.
4. Do not attempt to repair the product. The unit contains no electronic components that can be serviced or replaced by the user. Any attempt to service or repair the unit by the user will void the product warranty.
5. Products in the TransPort DR® family are designed for indoor use and should be used in an environment that is suitable for computers and other electronic equipment.
6. Ports that are capable of connecting to other apparatus are defined as SELV ports. To ensure conformity with IEC60950 ensure that these ports are only connected to ports of the same type on other apparatus.

Special notes on safety for wireless routers

Digi International products are designed to the highest standards of safety and international standards compliance for the markets in which they are sold. However, cellular-based products contain radio devices which require specific consideration. Please take the time to read and understand the following guidance. Digi International assumes no liability for an end user’s failure to comply with these precautions.

Wireless routers incorporate a wireless radio module. Users should ensure that the antenna(s) is (are) positioned at least 1 meter away from themselves and other persons in normal operation.

When in a hospital or other health care facility, observe the restrictions on the use of mobile phones. Do not use the unit in areas where guidelines posted in sensitive areas instruct users to switch off mobile phones. Medical equipment may be sensitive to RF energy.

The operation of cardiac pacemakers, other implanted medical equipment and hearing aids can be affected by interference from cellular terminals such as the wireless routers when places close to the device. If in doubt about potential danger, contact the physician or the manufacturer of the device to verify that the equipment is properly shielded. Pacemaker patients are advised to keep the wireless router away from the pacemaker while it is on.

Wireless routers must NOT be operated on aircraft. The operation of wireless appliances in an aircraft is forbidden to prevent interference with communications systems. Failure to observe these instructions may lead to the suspension or denial of cellular services to the offender, legal action, or both.

As with any electrical equipment, do not operate the unit in the presence of flammable gases, fumes or potentially explosive atmospheres. Radio devices should not be used anywhere that blasting operations are taking place.

Wireless routers receive and transmit radio frequency energy when power is on. Interference can occur if used close to TV sets, radios, computers or inadequately shielded equipment. Follow any special regulations and always power off your unit wherever forbidden or when it may cause interference or danger.

SOS IMPORTANT! - Wireless routers operate using radio signals and cellular networks cannot be guaranteed to connect in all possible conditions. Therefore, never rely solely upon any wireless device for life critical communications.

TransPort DR64

Installation Guide

Ethernet Cable

DSL Cable

Power Supply

(some models may include a DC Power Cord or have no Power Supply)

Cellular Antenna(s)

Wi-Fi Antenna [Wi-Fi models only]

Power Supply Adapters [Non-US models only]

If any item is missing or damaged, please contact your supplier. Also, make a record of any damage that may have occurred during shipping and report it to the carrier.

Depending on model and configuration, the package will also contain additional cables/antennas as appropriate.

Preface

This guide describes the installation procedure for the TransPort DR family of routers. It is intended to provide sufficient information to be able to connect the unit to terminal equipment and power-on the unit. A complete reference guide to the software features that are available on the product is available separately in PDF format and can be downloaded from the Digi International web site (www.digi.com).

2 Introduction

Digi TransPort DR cellular routers provide secure high speed wireless connectivity to remote sites and devices for primary or backup wireless broadband network connectivity. These multifunction cellular routers feature a flexible design with a variety of configuration options, including multiple serial ports (async or sync) or Wi-Fi modules, in addition to standard features like USB, serial and Ethernet.

Digi TransPort DR offers true advanced routing, firewall and security features including stateful firewall inspection and VPN. Enterprise-class protocols incorporate BGP, OSPF and VRRP+, a patented technology built upon the popular VRRP failover standard providing true auto sensing, auto failure and auto recovery of any line drop.

Most notably, the Digi TransPort DR features a built-in DSL modem for primary connectivity to remote sites, with failover to cellular or optional ISDN or PSTN. Integrated 802.11b/g Wi-Fi is also available. The router can be paired with the Digi TransPort VC7400 enterprise VPN concentrator for secure end-to-end connectivity for large numbers of remote devices and networks.

Digi TransPort DR routers are available on the following networks:

Model		GSM GPRS	GSM EDGE	WCDMA UMTS	WCDMA HSDPA	WCDMA HSUPA	CDMA EVDO / 1xRTT
Model	DR64-H	✓	✓	✓	✓		
	DR64-U	✓	✓	✓	✓	✓	
	DR64-C						✓

2.1 Front Panel Features

1. SIM / R-UIM Sockets (SIM card models only) - SIM 1 and SIM 2 are for use with the Subscriber Identification Module(s) (SIMs) or Removable User Identification Module(s) (R-UIMs).
2. LED Status Indicator - POWER - Illuminates steady when power is connected.
3. LED Status Indicator - LAN (0, 1, 2, 3) - Illuminates steady when there is a network connection to the LAN port and flashes when data is transmitted or received.
4. LED Status Indicator - WIFI - (Wi-Fi models only) Illuminates steady when there is a network connection to the wireless LAN interface and flash when data is transmitted/received.
5. LED Status Indicator - SERIAL - Illuminates steady if a terminal is connected to the serial port and the DTR signal is on. Flashes when data is transmitted/received.
6. LED Status Indicator - DSL.
 - Constant Red Illumination - No DSL is detected.
 - Quick Red Flash - DSL is detected and the unit is trying to train up to the DSL signal.
 - Constant Green Illumination - DSL is active.
 - Flashing Green - Data is being transferred.
7. LED Status Indicator - LINK - Illuminates steady when a wireless network has been detected.
8. LED Status Indicator - SIM - (SIM card models only) Illuminates steady when a valid SIM card is installed in the unit.
9. LED Status Indicator - ACT - Flashes to indicate that data is being transferred over the wireless network.
10. LED Status Indicator - SIGNAL.
 - 0 LEDs illuminated: < -113 dBm (effectively no signal)
 - 1 LED illuminated: >= -112 dBm and <= -87 dBm (weak)
 - 2 LEDs illuminated: >= -86 dBm and <= -71 dBm (medium)
 - 3 LEDs illuminated: >= -70 dBm and <= -51 dBm (strong)
11. LED Status Indicator - OH - Illuminates steady when the modem has gone off-hook.
12. LED Status Indicator - CD - Illuminates steady when the unit has connected to a remote modem and asserted the Carrier Detect signal at the serial port.
13. LED Status Indicator - DAT - Flashes when the unit has connected to a remote modem and data is being transferred.
14. USB Host Connector - The USB host connector may be used to connect compatible USB 2.0 client devices such as memory sticks, and serial adapters. The total current available to power USB devices is 0.5A.

2.2 Rear Panel Features

1. Secondary Wi-Fi (WLAN) Antenna Connector (Wi-Fi models only) - This SMA male connector is used to connect the unit's secondary Wi-Fi antenna.
2. Secondary Cellular (WWAN) Antenna Connector (DR64-U and DR64-C models) - This SMA female connector is used to connect the unit's secondary cellular antenna. It is highly recommended to use the secondary antenna for diversity. In most circumstances, dual antennas will provide improved signal strength thus better performance.
3. Primary Wi-Fi (WLAN) Antenna Connector (Wi-Fi models only) - This SMA male connector is used to connect the unit's primary Wi-Fi antenna.
4. Primary Cellular (WWAN) Antenna Connector - This SMA female connector is used to connect the unit's primary cellular antenna.
5. DSL Port - This RJ12 port is used to connect the unit to an ADSL line.
6. LAN Ports - These RJ45 ports are used to connect the unit to a 10/100 base-T LAN. These ports are auto-sensing for speed and wiring (straight-through or cross-over).
7. SERIAL 0 Port - This DB25 port (or optionally two DB25 or six RJ45 ports) provides an asynchronous RS232 serial port which may be used to connect the unit to a compatible serial device. This is a DCE serial port and allows CLI access to the device by default; the baud rate is 115200.
8. PSTN / ISDN Port - This RJ45 port is used to connect the unit to an ISDN or PSTN line.
9. Power Cord Input - This socket is used to connect the unit to a power source.

2.3 Under Unit Features

1. Unit mounting holes.
2. Reset button - The reset button allows the user to return the unit to its factory default settings. It is recessed [to avoid accidental reset], and can be accessed via a small 2.5mm hole located on the underside of the unit.

2.3.1 Configuration Factory Reset

Step 1) Turn the unit on and wait 15 seconds for the unit to complete its initialization process.

Step 2) Press and hold the reset button gently for 5 seconds. After this time, the unit will automatically re-boot and display a pattern of alternating LEDs flashing followed by the normal boot sequence.

Note: Do not remove power from the unit during this operation as corruption of the flash memory may occur.

3 Installation

Mounting Tips

The TransPort DR64 should be positioned on a flat, level surface or via a wall-mount, rackmount, or DIN rail mounting brackets (see the Accessories section on page 20 for all options). The unit is designed for indoor use and should be mounted in a location with adequate ventilation. Also, do not expose the unit to extremes of heat or cold, strong magnetic fields, or liquids.

Step 1) (SIM card models only) - Install the SIM card(s): SIM card(s) should be inserted into SIM Sockets as illustrated in the above Front View image. For SIM 1, the contacts should be face down. For SIM 2, the contacts should be face up. In both cases, the end of the SIM card with the chamfered corner should be inserted first.

Note: For DR64-C models, not all networks require/support the use of Removable User Identity Modules (R-UIM's). If your service provider does not support R-UIMS, the unit may have been "provisioned" for use on your chosen network before you receive it and this step of the installation procedure will not be required. If the unit has not been provisioned, you will need to contact your service provider to obtain an "IMSI" and "NAI" in order to provision the unit manually.

The TransPort DR64 also allows for dual network installations where one wireless service can be used as a back-up in the event that the primary service fails. These installations cannot be used to access two networks simultaneously. By default, SIM 1 is used for access to the primary network and SIM 2 is used for the back-up network.

For added security, Digi offers a "SIM Slot Cover Plate" that can be installed on the unit to deter theft or tampering of the SIM cards, (see the Accessories section on page 20 for more information).

Step 2) Connect the Cellular (WWAN) Antenna(s): Connect the cellular antenna to the "WWAN PRIMARY" connector (SMA Female) on the unit. If the unit is equipped with a secondary cellular antenna connector (WWAN SECONDARY), it is highly recommended to connect an additional antenna to this connector for diversification. Dual antennas will provide improved signal strength thus better performance.

Note: For most applications, the antenna(s) included with the unit will provide suitable reception, but some circumstances/environments may require a higher quality antenna or one mounted in a different location. If this is the case, Digi has many antenna options to chose from -- please contact us or visit www.digi.com. If antennas other than the supplied antenna(s) are used, the separation between the two should be no less than five inches (5").

Step 3) Connect the LAN Cable: Connect one end of the Ethernet cable to the "LAN" port on the unit and the other end to a LAN port on a PC.

Step 4) Connect the DSL Cable: Connect one end of the DSL cable to the "DSL" port on the unit and the other to an ADSL line.

Step 5) Connect the PSTN/ISDN Cable: Connect one end of a PSTN or ISDN cable (not included) to the PSTN/ISDN port on the unit and the other end to a PSTN or ISDN wall socket.

Step 6) Connect the Serial Cable (optional): Connect one end of the serial cable (not included) to the "SERIAL 0" port on the unit and other end to the serial port on a third-party serial terminal device. If you wish to connect the unit to a PC, it is recommended that you purchase Digi's DB25 to DB9 serial cable (P/N: 76000871).

Step 7) Connect the Power Supply: Connect the barrel end of the power supply to the power connector on the unit, and plug the other end into a wall outlet. "International" units come with interchangeable power supply adapters which can be used according to regional needs.

Step 8) When the unit is powered-up, the POWER indicator will illuminate and the unit will initiate a series of diagnostic self-tests. During this process one or more of the other indicators will flash to show that the unit is busy. When the flashing stops, the unit has completed its self-test diagnostics and is ready to be configured.

4 Configuration

Once the unit has been installed and powered up, it needs to be configured to communicate with the LAN and WAN. Configuration is performed either using the Command Line Interface (CLI) or the Web Interface. The Web Interface (accessed via a web browser e.g. Firefox, IE, Chrome) is the recommended configuration option for most users.

Note: You will not be able to use the router on a mobile/cellular network until you have subscribed to a suitable mobile/cellular wireless network service.

4.1 Network Settings

The default IP address for the LAN port is 192.168.1.1 with a subnet mask of 255.255.255.0. The unit has a DHCP server enabled by default which can assign an appropriate IP address to your PC if the PC is configured to get an IP address automatically. Alternatively you can manually configure your PC to be on the 192.168.1.x network, for example, with an IP address of 192.168.1.2 and subnet mask of 255.255.255.0. Care should be taken to ensure that the unit does not conflict with other devices that may already be on the network.

4.2 Web Interface

Step 1) Connect to the Web Interface: Open a Web browser (e.g. Firefox, IE, Chrome) on your PC and navigate to `http://192.168.1.1`. If successful, you will be prompted to enter a username and password. The default username is “username”, and the default password is “password”. After you have logged in, it is strongly recommended that you immediately change the default username and password.

If you are unable to connect to the Web Interface, please refer to the Troubleshooting section on page 18.

Step 2) Configure the Unit: The easiest way to perform the initial configuration of the unit is by using the Quick Start Wizard. This wizard allows you to configure the following items where applicable:

- Username and password
- LAN IP settings
- DHCP Server
- Mobile module and connection
- Wi-Fi Access Point

The Quick Start Wizard is located in the Getting Started section on the Home menu.

4.2.1 Cellular: CDMA

If your unit is to be used on a CDMA network, the embedded module must be provisioned on the network before it can make a connection.

Note: If your unit uses a Gobi module (indicated by a model number of DR64-U5xx-xxx-xx), and you did not select the appropriate CDMA carrier via the Quick Start Wizard, you must run the GOBI Module Carrier Wizard before provisioning can be successfully completed.

To provision the CDMA mobile device, navigate to the CDMA Provisioning section by clicking on **Network > Mobile > CDMA Provisioning**.

4.2.1.1 CDMA Provisioning

CDMA provisioning is different from GSM since CDMA (in most cases) does not use a SIM card.

The CDMA modem provisioning process creates a CDMA data connection to the mobile carrier network. This authenticates the modem and retrieves account information which is written to flash memory on the modem module itself, not the Digi's configuration file. As the mobile account information is stored on the CDMA module, performing a factory reset on the unit will not remove provisioning information from the CDMA module.

Important points:

- The modem must be provisioned on the network before it will communicate.
- The modem must be in coverage area of the native carrier. It cannot be roaming.
- There must be sufficient signal strength available to provision the modem.
- Always use MIP Profile 1 for manual provisioning unless specified otherwise by your carrier or Digi Technical Support.

4.2.1.2 Automatic vs. Manual Provisioning

There are two types of CDMA provisioning: *Automatic* and *Manual*. This varies between carriers and even within carriers. Settings in the Web Interface vary based on carrier plan. Below are examples for Verizon Wireless and Sprint:

Verizon Wireless always uses *Automatic*. This means that no further settings are required in the Web Interface - simply press Start in the Automatic section and leave the fields blank.

Sprint has two types of plans, Vision for standard Internet connections and DataLink for private IP plans:

1. Sprint Vision uses *Automatic* provisioning. There are three fields of information that may need to be populated in the Automatic screen. Check with Sprint for correct values (if required).
2. Sprint DataLink requires *Manual* provisioning. The required fields in the Web Interface vary based on plan and type of embedded modem. As noted above, always use MIP Profile 1 unless otherwise specified by your carrier or Digi Technical Support.

Check with your carrier for information about the type of provisioning required and what, if any, data is required to be entered.

For more information on configuring the unit, please refer to the Digi TransPort User Guide which is available at www.digi.com.

4.2.2 Cellular: GSM

To configure the Wireless WAN/mobile interface on non-CDMA routers (GPRS/UMTS/HSPA), please refer to the Application Guide "QN02 - Configure the wireless WAN (PPP) interface" which can be found on the Digi Support site (<http://www.digi.com/support/>).

It is also essential to configure a dead link detection mechanism for routers using a Wireless WAN/mobile interface (such as GPRS/HSDPA/CDMA). Please refer to the Application Guide "AN07 - Wireless - Wide Area Network (W-WAN) Problem Detection and Recovery" which can also be found on the Digi Support site (<http://www.digi.com/support/>).

4.3 Command Line Interface (CLI)

In order to configure the unit via a serial cable connection, ensure that the unit is connected to a PC (as outlined in Step 6 on page 11 of the Installation section). Also, terminal emulation software (such as HyperTerminal or TeraTerm) will be required.

4.3.1 CLI Notes

- To view the current configuration settings, enter the command **CONFIG C SHOW**.
- To save changes made to the unit, enter the command **CONFIG 0 SAVE**.
- All entered commands will take effect immediately.

4.3.2 Communication Settings

Step 1) Configure the following settings for the unit:

- COM Port: [select the appropriate port; typically COM1]
- Baud Rate: 11500
- Data Bits: 8
- Stop Bits: 1
- Parity: No Parity
- Flow Control: None

Step 2) Ensure the connection is active by entering the command **AT**. If the device is functioning properly, it will return the response OK.

Step 3) Confirm the correct PC COM port is in by entering the command **ATI5**, this will report the router firmware and hardware version. The output should begin ‘Digi TransPort DR64’.

4.3.3 Network Settings

To configure the unit with an IP address as part of an existing network, use the commands below.

Note: The DHCP server will still operate unless it is disabled.

Command	Description
ETH 0 IPADDR XXX.XXX.XX.XXX	Sets the Eth 0 IP address
ETH 0 MASK XXX.XXX.XX.XXX	Sets the Eth 0 subnet mask

As an example, to assign the IP address 192.168.10.254/24, the following commands would be entered:

ETH 0 IPADDR 192.168.10.254

ETH 0 MASK 255.255.255.0

Note: When setting the mask to the above 255.255.255.0 value, it will not appear in the output of the **CONFIG C SHOW** command as it is a default value.

To stop the DHCP server from serving addresses, use the following command:

Command	Description
DHCP 0 IPMIN !	Removes the minimum IP address that will be server via DHCP, disabling the DHCP server

As an example, to stop the DHCP sever from DHCP requests, enter the command **DHCP 0 IPMIN !**. The **!** variable is used to remove a value or set it back to its default.

To retain the DHCP server, but on a different subnet, the following parameters will need to be configured:

Command	Description
DHCP 0 IPMIN x.x.x.x	Minimum IP address to assign, the start of the DHCP pool
DHCP 0 IPRANGE n	The number of IP addresses in the DHCP pool
DHCP 0 GATEWAY x.x.x.x	The IP gateway address the DHCP clients should use (normally this router’s LAN IP address)
DHCP 0 MASK x.x.x.x	The subnet mask DHCP clients should use
DHCP 0 DNS x.x.x.x	The DNS server DHCP clients should use

For more information on CLI commands, visit <http://www.digi.com/support/> and view the various reference manuals available.

5 Troubleshooting

5.1 Troubleshooting Resources

There are several resources available to you for support of your Digi product or resolving configuration difficulties at Digi’s Support site, <http://www.digi.com/support/>. Try these troubleshooting steps to eliminate your problem. After working through these steps and your problem is not solved, try the resources listed below.

1. Digi’s Support knowledge base: <http://www.digi.com/support/kbase>.
2. Digi TransPort support documents: <http://ftp1.digi.com/support/documentation/transport/technicalnotes.htm>.
3. If the knowledge base or support forums do not have the information you need, submit an Online Support Request via: <http://www.digi.com/support/eservice/login.jsp?p=true>. You will need to create a user account if one is not already set up.

When submitting a support request, please include a copy of the debug.txt file from the unit’s flash. This will greatly improve the quality of the initial response you receive. Without this file, it is often very difficult for the support team to provide accurate answers to your queries.

For instructions on how to download the debug.txt file from the unit, view the online document “QN24 - Extracting the debug.txt file from a Digi TransPort or Sarian router”.

5.2 Unable to open the Web Interface

Ensure that the LAN cable is properly connected to the LAN port and that the “LAN” status indicator on the front of the unit is illuminated. If it is not, then there is a problem with either the LAN cable or the device it is connecting to. If the status indicator is illuminated, check that the PC can communicate with the unit. To do this, open the Command Prompt window on your PC and enter the command “ping 192.168.1.1”. If you do not get a response, then the problem could be one of the following:

- The IP address of the unit has been changed from its default of 192.168.1.1. Use the Digi TransPort Connection Wizard (which can be downloaded from the Support area at Digi.com or the Digi Device Discovery Tool). It can usually discover the unit on a network as long as the unit’s firewall has not been enabled.
- PC IP configuration. The PC’s LAN interface that is connected to the unit should be configured to “Obtain an IP address automatically”. If required, the Digi TransPort Connection Wizard can be used to configure the PC.
- Check the PC’s LAN connection and any LAN device (e.g. Ethernet switch) that is used to interconnect to the unit.
- Refresh the PC’s IP settings by opening a command window and enter “ipconfig /release” then “ipconfig /renew”.
- ARP resolution. Clear the PC’s ARP cache with the command “arp -d *”, then retry the ping command. If you do get a response but are unable to view the Web Interface, then there is most likely a problem with your web browser configuration.

5.3 Unable to log in to the Web Interface

Access to the unit can be achieved via any of the asynchronous serial ports. Connect your PC to the unit using a “straight through” RS232 serial cable. This will allow you to change the configuration via the Command Line Interface (CLI). Please refer to the Digi TransPort User Guide for information on how to use the CLI. The User Guide can be downloaded from the Digi Support site. If you have further questions about your product please contact Digi Technical Support (see page 2 for contact information).

6 Specifications

Specifications	Digi TransPort DR64
General Features:	
Dimensions (L x W x H)	5.9" x 9.4" x 1.4" (15 cm x 24 cm x 3.5 cm) *Height of DR6460 / DR6420 models is 1.9" (4.7cm)
Weight	2.0 lb (0.9Kg)
RF Features:	
GSM Models	
HSDPA/HSUPA/UMTS	Tri-band 850/1900/2100 MHz with Rx Diversity
Antenna	GPRS and EDGE: 1 x 50 Ω SMA male antenna
CDMA Models	
EV-DO Rev A	Dualband 800/1900 MHz with Rx Diversity
Power Requirements:	
Power Input	12VDC
Power Supply	Supplied with universal 100-240VAC 50/60 Hz plug-top mains adapter
Power Consumption	Typical: 6.0W, Max: 10W
Environmental:	
Operating Temperature	-20° C to +55° C -20° C to +70° C with reduced cellular performance
Relative Humidity	20% to 95% (non-condensing)
Ethernet Isolation	1.5 kV
Serial Port Protection (ESD)	1.5 kV
Approvals:	
Mobile Certifications - GSM/UMTS	PTCRB, NAPRD.03, GCF-CC, R&TTE, EN 301 511
Mobile Certifications - CDMA/EV-DO	CDG TIA/EIA-690, CDG TIA/EIA-98-E
Wireless Carrier Certifications	Certified by most major carriers. See www.digi.com for current listing.
Safety	UL 60950, CSA 22.2 No. 60950, EN60950
Emissions / Immunity	CE, FCC Part 15 Class A (FCC identifier GGL-R1902G), AS/ NZS CISPR 22, EN55024. EN55022 Class B
